Nullled Contract Vanzare Cum X32 Pc Iso. 2021.11.12 04:42. image .1. Field of the Invention The present invention relates to a power source circuit, an electronic device, and a method of controlling the same, and more particularly, to a power source circuit, an electronic device, and a method of controlling the same, which includes a step-up circuit. 2. Description of the Related Art A power source circuit or electronic device includes a power source voltage step-up circuit. A first step-up circuit supplies a predetermined voltage to a load. A second step-up circuit supplies an output voltage which is higher than the predetermined voltage to the load. In the related art, the first step-up circuit includes a plurality of switching elements, such as MOSFETs, for stepping up the power source voltage. Each of the plurality of switching elements includes a first transistor, a second transistor, and a control circuit which controls the second transistor. The first transistor is controlled by the control circuit so as to be turned on and off. When the first transistor is turned on, a current path from the power source voltage to the ground voltage is established. The control circuit turns off the first transistor when a predetermined period passes. Thus, the first transistor is turned on only when an output current supplied to the load flows. The second transistor controls the output

voltage. The control circuit stops controlling the second transistor when the second transistor is turned off. When the first transistor is turned off, a current path from the power source voltage to the ground voltage is shut off. The control circuit turns on the second transistor when the predetermined period passes. Thus, the second transistor is turned on only when an output current supplied to the load does not flow. In the above-mentioned related art, a signal indicating the control of the second transistor is output to the control circuit. The control circuit stops controlling the second transistor when the control signal from the second transistor is output. Thus, when the second transistor is turned off, the first transistor is turned off after the predetermined period passes. Thus, there is a time lag between when the first transistor is turned off and when the second transistor is turned off. The time lag between when the first transistor is turned off and when the second transistor is turned off causes noise. When the second transistor is turned on, the current path is shut off. Thus, there is a time lag between when the first transistor is turned off and when the second transistor is 82157476af
